

At one time, a missing tooth meant a lifetime of pain. But times have changed – dental implants, a lifesaver for many, are becoming the standard in care.

Dental implants are titanium screws that take the place of the missing tooth. They are inserted surgically into the jaw and allowed to integrate into jawbone. After they “fuse” to the bone, a crown is placed on top of the screw that looks, feels and functions just like a natural tooth!

Dental Implants Offer Several Advantages

There are several advantages that dental implants have over dentures and bridges:

- The ability to chew and eat anything is restored.
- Renewed, natural-looking smile.
- Preserve the jawbone.
- No embarrassing mishaps as with dentures.
- A better quality of life.

A Prosthodontist – The Best Choice for Dental Implant Surgery

When choosing a provider, it’s important to consider the quality of his or her work, available technology, success rate and experience. A Prosthodontist does 3 years of additional training beyond dental school, and I have personally placed over 2,500 dental implants successfully. Our in-house lab and the use of CBCT scan generated surgical guides allow us to provide you with the highest quality implant experience possible.

In good health,

Dr. Gerald Marlin 4400 Jenifer Street NW Suite 220 | Washington, DC 20015; (202) 244-2101
